**Sensitivity to the intrinsic thickness $q_0$**

| Variant | $N_{\rm FRB}$ | $N_{\rm control}$ | Quartile counts (face-on → edge-on) | AD $p_{\rm m}$ | MW two-sided $p_{\rm m}$ | MW one-sided $p_{\rm m}$ |
|---|---|---|---|---|---|---|
| $q_0 = 0.10$ | 57 | 24,976 | 14,19,10,14 | 0.57 | 0.43 | 0.21 |
| $q_0 = 0.15$ | 57 | 24,870 | 14,19,10,14 | 0.59 | 0.46 | 0.24 |
| $q_0 = 0.20$ | 56 | 24,450 | 14,19,10,13 | 0.55 | 0.45 | 0.23 |
| $q_0 = 0.25$ | 52 | 23,699 | 14,18,10,10 | 0.21 | 0.17 | 0.087 |

$p_{\rm m}$: fraction of 10,000 random control samples of the same size that differ from the control at least as much as the FRB hosts.
The one-sided MW test is run in the direction of an edge-on deficit. With 10,000 draws the smallest possible $p_{\rm m}$ is $10^{-4}$.
The cut $q > q_0$ is applied to both samples.
