[a] Boldface indicates FRB hosts for which Pan-STARRS1 DR1 (or, for FRB 20240208A, HSC-SSP PDR2) r-band images were used. For all other hosts we use Legacy Surveys DR10 r-band images (DR9 for FRBs 20190523A and 20230907D).

[b] The first inclination angle in each row is from the GALFIT single-Sérsic fit; the second is from the independent AstroPhot fit of the same image. Both use $\cos^2 i = (q^2 - q_0^2)/(1 - q_0^2)$ with $q_0 = 0.2$. Bins are equal-width in $\cos i$ (edges at $i = 41.4°$, $60.0°$, $75.5°$).

[c] $SFR_{0-100\,Myr}$ and stellar mass are SED-fit values taken from the references in the last column (Prospector for the DSA-110 and CRAFT hosts; CIGALE or Bagpipes where no Prospector fit exists). log(sSFR) is computed from the two tabulated values. †: Hα-based SFR (no SED SFR published); ‡: SED SFR over the last 20 Myr only. Every published alternative is listed in Tables 2 and 3.

[d] Rest-frame host contribution, $[\mathrm{DM} - \mathrm{DM}_{\mathrm{MW,NE2001}} - \widetilde{\mathrm{DM}}_{\mathrm{cosmic}}(z)]\,(1+z)$, where $\widetilde{\mathrm{DM}}_{\mathrm{cosmic}}$ is the median of the J. P. Macquart et al. (2020) distribution ($F = 0.2$, Planck 2018). No halo term is subtracted, following M. Bhardwaj et al. (2024).

[e] GALFIT r-band magnitude from this work (AB).

2. EXTENDED PUBLISHED PROPERTIES

Table 2. Burst and dispersion-measure properties of the 51 hosts
